

Skylight Calendar — Quick Start Guide

Get your Raspberry Pi calendar display up and running in 15 minutes

Skylight Calendar Project

June 2026

What You Need

Item	Details
Raspberry Pi	Model 4 or 5 (2GB+ RAM)
TV or Monitor	Any HDMI display (1080p recommended)
Micro-HDMI cable	Connects Pi to TV
iPazzPort Keyboard	KP-810-19S (2.4G wireless with touchpad)
Network	WiFi or Ethernet
Google Account	For calendar sync

Step 1: Set Up Google Cloud (5 minutes)

1. Go to **console.cloud.google.com** and create a project
2. Enable the **Google Calendar API** (search in Library)
3. Create **OAuth 2.0 credentials** (Credentials → Create → OAuth client ID)
 - Type: Web application
 - Redirect URI: `http://localhost:3001/api/auth/callback`
4. Copy your **Client ID** and **Client Secret**

Step 2: Install on the Pi (5 minutes)

```
# Clone the repository
git clone https://github.com/cnbp173/skylight-calendar.git ~/skylight-calendar
cd ~/skylight-calendar
```

```
# Create your config file
cp .env.example .env
nano .env
```

Fill in your `.env` file:

```
GOOGLE_CLIENT_ID=your-client-id-here  
GOOGLE_CLIENT_SECRET=your-client-secret-here  
GOOGLE_REDIRECT_URI=http://YOUR_PI_IP:3001/api/auth/callback
```

Then install and run the setup:

```
npm install && cd server && npm install && cd ../client && npm install && cd ..  
bash scripts/setup-pi.sh  
sudo reboot
```

Step 3: Connect Google Calendar (2 minutes)

After reboot:

1. Find your Pi's IP: run `hostname -I` on the Pi
2. From any device on the same network, open: `http://PI_IP:3001`
3. Click **“Connect Google Calendar”**
4. Sign in with Google and grant permissions
5. The calendar appears on your TV automatically

Using the Calendar

Viewing Events

The calendar shows a 7-day week view. Use the **navigation arrows** at the top to move between weeks. Events are color-coded by calendar.

Moving Events (Drag-and-Drop)

Move an event to another day **within the current week**:

1. Point the iPazzPort touchpad at an event
2. **Click and hold**, then slide to the target day
3. The target column highlights blue
4. **Release** to drop — the event moves and syncs to Google Calendar

Editing Events (Double-Click)

Change title, date, time, or description:

1. **Double-click** any event to open the edit dialog
2. Modify the fields you want to change
3. Click **“Save Changes”** (or press Enter)
4. Click **“Cancel”** (or press Escape) to discard

Tip: Use the edit dialog to move events to a date outside the current week — the date picker allows any date.

Keyboard Shortcuts

Key	Action
Tab	Navigate between elements
Escape	Close edit dialog
Enter	Submit edit form
Double-click	Open event editor
Click + drag	Move event to another day

Troubleshooting

Problem	Solution
“Not authenticated”	Visit http://PI_IP:3001/api/auth/login to re-connect
Events won’t move	Re-authenticate to grant write permissions
Can’t see cursor	Ensure global.css has <code>cursor: default</code> (not <code>none</code>)

Problem	Solution
Drag feels too sensitive	Adjust the 5px distance in <code>WeekView.jsx</code> <code>PointerSensor</code>
Edit dialog won't open	Ensure you're double-clicking (not single-click)
Changes don't sync	Check <code>journalctl -u skylight-calendar -f</code> for errors

Weather (Optional)

To show weather on the display:

1. Sign up at **openweathermap.org**
2. Get a free API key (One Call API 3.0)
3. Add to your `.env`:

```
OPENWEATHER_API_KEY=your-key
WEATHER_LAT=40.7128
WEATHER_LON=-74.0060
```

4. Restart: `sudo systemctl restart skylight-calendar`

Need Help?

- Full documentation: `docs/skylight-calendar-documentation.md`
- Check server status: `sudo systemctl status skylight-calendar`
- View logs: `journalctl -u skylight-calendar -f`
- Find Pi IP: `hostname -I`
